Bredikhin S.N. Hierarchical noematic superstructure vs. Frame in the conceptual sense derivation

This article is devoted to hierarchical noematic structure of sense realized in the text. The paper discusses the possibility of a new approach to the analysis of sense derivation when conceptualizing ideas. The sense superconstruction is considered as hierarchical structure of the intentional relevant noems as the smallest quanta of multidimensional and many-sided sense. The paper describes the principles of phenomenological and noematic reflection as the basis for sense-decoding and derivation as well at the intuitive level, as at the third level of abstraction. Sense derivation models are close connected with use of correct intent techniques at phenomenological philological reflection over verbalized in signs and symbols/linguistic units, texts – mental constructs, all this causes the birth of proto- and meta-sense, new formation in semantic structure, text creation within and beyond understanding. A new methodological approach, called philological phenomenological hermeneutics, is an attempt to organize methodological apparatus of cognitive linguistics, phenomenology and hermeneutics, and build a more coherent concept of sense.

Key words: noem, sense derivation, noematic reflexive structure, phenomenological reflexive structure, proto- and meta-sense, superstructure.
