Gritsenko G.D., Kokorin S.A. **Information resistance to terrorism: reality and opportunities**

The article discusses the features of modern terrorism, which are caused by the use of new network technologies, allowing terrorists to use various forms and methods of the negative impact on information-psychological situation in the world in order to create social and psychological shock from the masses of people. In such circumstances, combating terrorism is a complex task, requiring development of clear and effective information policy to combat terrorism, which depends on the interaction between the government and the media. The necessity not only of legislative regulation of the behavior of the journalist in the terrorist threat and techniques of lighting attacks and counter-terrorist operations, but also journalistic community should recognize the need to voluntarily limit their activity in conditions of terrorist threats. The article also notes the importance of "anti-terrorist" training and education of all members of society.

Key words: information technology of a terrorist war, freedom of information activities, the boundary of independence and autonomy in the mediation of terrorist threats, the legal regulation of the activity of the journalist in the field of terrorist threat, professional code of ethics of the journalistic community.
