### **Complexity of consciousness and thinking: experience of comprehension**

Human knowledge keeps facing more complex objects: technical, information, cultural, social. At the same time, one of the most intricate problems is the complexity of human consciousness. The modern science departs from a problem of a ratio of material and ideal in the nature of consciousness and pays attention to its structure, a ratio of the simple and the difficult in its being. It is offered to look for either "simple" conditions of consciousness due to which there is a difficult picture of consciousness, or the "simple" program principle which orders variety of mental conditions. The complexity thinking is considered as special discourse practice which legitimates pluralism, allows to realize relativity of definite historical models in the description of reality.

Key words: thinking, simplicity, rationality, complexity, consciousness.
