### **Communicative nature of the notion «term» (experience of Russian and foreign linguistics)**

The article considers the evolution of the notion “term” in domestic and foreign linguistics. The development of science and technology over the past decades has given rise to the appearance of specifically professional communication and a vast number of terms that have led to the formation of a separate area of linguistics – the terminology, the peculiarity of which many linguists have tried to identify. The issues of the terminological language of communication, the processes of production and self-production of communicative concepts, the features of their functioning and interpretation in a variety of communicative technologies, processes, models and their implementation in various sociocultural contexts are discussed. It is important to consider the basic theoretical provisions necessary for the study of various aspects of the terminology of interpersonal communication, since commonly used vocabulary and special vocabulary are two separate areas of functioning of a language that have different goals for their use, objects of their study and problems differ. So, a historical approach to the problem of the formation and development of the terminological system of the language is considered. A wide range of terminology techniques is presented, since terminology is a constantly evolving science. Each area of science and production is characterized by a special terminology, that is, its own system of terms.

Key words: word, term, communication, synchronic approach, lexicon, notion.
